

## IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently amended) A well system, comprising:

a completion positioned in a wellbore to pump a production fluid, the completion comprising an electric submersible pumping system;

a tubing coupled to the completion;

a bypass coupled to the tubing for carrying a well treatment fluid past the completion; and

a diverter valve disposed in cooperation with the tubing and the bypass to selectively direct either flow of the well treatment fluid through the tubing to the bypass or flow of production fluid from the completion through the tubing.

2. (Canceled)

3. (Original) The well system as recited in claim 1, wherein the tubing comprises production tubing

4. (Original) The well system as recited in claim 1, wherein the bypass comprises a conduit that directs fluid past the completion.

5. (Original) The well system as recited in claim 4, wherein the conduit comprises a tube.

6. (Original) The well system as recited in claim 1, wherein the diverter valve comprises a flapper valve.

7. (Original) The well system as recited in claim 1, wherein the diverter valve is movable between a first position blocking flow through the tubing and a second position blocking flow through the bypass.

8. (Currently amended) ~~The well system as recited in claim 1, further comprising~~ A well system, comprising:

a completion positioned in a wellbore to pump a production fluid;

a tubing coupled to the completion;

a bypass coupled to the tubing for carrying a well treatment fluid past the completion;

a diverter valve disposed in cooperation with the tubing and the bypass to selectively direct either flow of the well treatment fluid through the tubing to the bypass or flow of production fluid from the completion through the tubing; and

a packer, wherein the bypass is connected to the tubing at a position below the packer.

9. (Currently amended) A method of treating a subsurface formation, comprising:

locating a diverter valve in a tubing through which a fluid is produced;

engaging a treatment fluid flow path with the tubing; and

utilizing the diverter valve to obstruct flow in the tubing while enabling flow along the treatment fluid flow path;

actuating the diverter valve to remove the obstruction in the tubing and to block flow along the treatment fluid flow path; and

producing fluid through the tubing with a submersible pump powered by a motor.

10. (Original) The method as recited in claim 9, further comprising pumping a treatment fluid through a portion of the tubing and then along the treatment fluid flow path.
11. (Original) The method as recited in claim 9, further comprising coupling a completion to the tubing.
12. (Canceled)
13. (Canceled)
14. (Currently amended) The method as recited in claim 11, wherein coupling comprises coupling an ~~and~~ electric submersible pumping system to the tubing.
15. (Currently amended) The method as recited in claim 11 ~~12~~, wherein actuating comprises moving a flapper from a position closing the tubing to a position closing the treatment fluid flow path.
16. (Original) The method as recited in claim 11, wherein engaging comprises connecting a bypass tube to the tubing to direct a treatment fluid past the completion.
17. (Currently amended) A system for pumping fluid in a wellbore with a completion deployed in the wellbore on a tubing, comprising:

a diverter valve controllable to enable flow of a production fluid through the tubing; and

a bypass conduit in fluid communication with the diverter valve to isolate the completion from well treatment fluid introduced through the diverter valve, wherein the bypass conduit comprises a tube extending from the diverter valve to a position past an opposite end of the completion.

18. (Original) The system as recited in claim 17, wherein the diverter valve is mounted to the tubing.
19. (Original) The system as recited in claim 18, further comprising a packer through which the tubing extends.
20. (Original) The system as recited in claim 17, further comprising a completion having a submersible pump powered by a submersible motor.
21. (Original) The system as recited in claim 18, wherein the diverter valve comprises a flapper movable for selective closure of the tubing string and the bypass conduit.
22. (Canceled)
23. (Currently amended) A system for treating a well, comprising:

means for producing a wellbore fluid, the means for producing comprising an electric submersible pumping system;

means for carrying the wellbore fluid or a well treatment fluid; and

means for bypassing the means for producing when the well treatment fluid is introduced into the well.

24. (Canceled)

25. (Original) The system as recited in claim 23, wherein the means for carrying comprises a tubing.

26. (Original) The system as recited in claim 23, wherein the means for bypassing comprises a diverter valve coupled to bypass conduit.
